

Baseline and Data Collection Methods

Alabama Department of Mental Health

Meghann Kernan, M.Ed., BCBA, LBA

BASELINE DATA

Baseline data is collected before any intervention has been put into place

 Allows for comparison of the behavior before and after plan implementation to determine effectiveness

Collect data on positive behaviors too!

Don't forget to collect data on the positive behaviors as well! If you are targeting task refusal, log when the individual completes the instruction immediately.

Steps in measuring behavior

- Select a target behavior (s)
- Assess the target behavior (s)
- Define the target behavior (s)
- Identify if the behavior occurs not enough / too much
- Determine measurement system
- Graph data

Define Behavior

Observable and measurable
 {What the behavior looks like, not how it makes you feel!}

Behavior	Defined
Off Task	Plays with objects on desk, spins in chair, looks out window
Poor organization and planning	Rushes to complete work tasks; waits until the end of the period to begin tasks
Disruptive / Outbursts	Throws materials, screams at peers, slams objects on desk

Gather Information

- Collect data on target behavior
 - Observations
 - Interviews
 - Record review / past information
- Look at the antecedents
- Look at the consequences

```

                                            Other:
```

Notes:

OUTLINE THE BEHAVIOR

- Notice strengths
- Identify possible fast triggers
- Identify possible slow triggers
- Outline consequences
- Is the behavior occurring too often or not frequently enough

Functional Behavior Assessment

IDENTIFY PROBLEM BEHAVIOR(S)

Gather data and complete interviews

Review and Revise!!!!

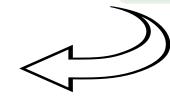

Hypothesize Needs

Develop Behavior Plan

Implement Behavior Plan

Evaluate Behavior Plan

COLLECTING BEHAVIOR DATA

- Frequency
- Duration
- Latency
- Intensity
- Anecdotal Reports
- Time Sampling

All behavior occurs within a **context.**It may not be the actual form of the behavior that is inappropriate, but the duration, intensity, or rate with which the

FREQUENCY RECORDING

Only use for situations when the behavior has a clear beginning and end!

Pro: Easy for staff to collect data

Con: May not be the best method of data collection for long lasting behaviors **<u>Definition</u>**: the number of times an individual engages in a behavior within an observation period.

Measurement: count incidents of behavior (tally marks)

Examples:

- Number of instances of yelling "DONUT" during 15 minutes of meal prep practice.
- Number of positive statements made by staff during a 20-minute period.

DURATION

Duration is great for highrate behaviors that have a clear beginning and end.

Pro: Recording total length of an episode is often more accurate and reliable than counting each instance for longer occurring events.

Con: You aren't recording the total number of incidents within an episode

Definition: how long an individual engages in a behavior

Measurement: timing how long an individual engages in...

...one instance of behavior

...one behavior throughout a period (cumulative)

Example:

 Individual was on task and completed all steps during a I5-minute meal prep practice.

LATENCY

Great for tracking how long it takes someone to complete a task! Good data method for social goals / learning objectives.

Pro: Great way to track if an individual is becoming more independent with a skill.

Con: Only useful method if you are providing a CLEAR instruction before you want a behavior to occur

<u>Definition</u>: the amount of time between the instruction and a behavior

Measurement: timing interval between instruction and when student begins to perform

Example:

- Individual begins completing chores 5 minutes after instruction was given.
- Individual completes a task independently for 7 minutes before asking for a break.

INTENSITY

Useful for gauging priority level for particular behaviors or skill.

Pro: Intensity is helpful for individuals with several high rate behaviors that vary in severity.

Con: Can be subjective depending on who is scoring. It may be best to have a criteria for collecting intensity data.

Definition: the severity of a behavior

Measure by: observation (subjective) or apparatus designed to measure intensity

Example:

- Individual hit hard enough to leave a bruise/scratch
- Individual spoke loudly enough to be heard
- Sound sensitive traffic lights in cafeterias
- Rating day on a I (quiet) to 5 (dangerous to self or others) scale

Level I	Level 2	Level 3
Less than 5 minutes	5-10 minutes	Over 10 minutes
No property damage	Property damage up to \$50	Property damage over \$50
Audible from the same room	Audible from outside of room	Audible from outside of building
No risk of injury	First Aid required	Medical Attention needed

HOW TO PICK A MEASUREMENT SYSTEM

WHO is collecting the data

HOW does the data need to be collected

BALANCE what is practical with what will be the most precise

ANECODOAL REPORTS

What is it?

Written description of what is going on within a setting

When use it?

- To measure topography, locus, and force(?)
- Generating operational definitions.
- Developing a task analysis ("how to" steps)
- Writing A-B-C notes to identify possible function and behavior chains

INTERVERAL RECORDING AND TIME SAMPLING

Definition Ways to estimate the number of times a behavior occurs.

Example:

Used for higher frequency discrete behaviors or behaviors of longer duration.

Interval recording yields a slightly more accurate estimate.

Time sampling is more practical if you are doing two things at once (i.e., teaching and recording data).

INTERVAL RECORDING

Interval Recording	Notes	Pros	Cons
Whole Interval	Mark if the behavior occurred throughout the ENTIRE interval	Useful for behavior that will continue for longer period of times or behaviors you want to INCREASE	Underestimates behavior and requires observation for the entire interval
Partial Interval	Mark if the behavior occurred at any point in the interval	Useful for short lived behaviors that are difficult to track	May overestimate behavior, requires observation for the entire interval
Momentary Time Sampling	Mark whether or not a behavior occurs at the end of an interval.	Easiest data collection on multiple behaviors, useful for very frequent behaviors or behaviors that last a long period of time	May miss instances of behavior, may underestimate behavior

PERMANENT PRODUCT

<u>Definition</u> Measuring a specific outcome you can see like, making the bed, sweeping, or clearing the table.

Example:

<u>Frequency/Rate</u>— steps in morning routine completed independently

Locus—where did the fight occur

Topography—QUALITY of a task, wiping the table without leaving any crumbs

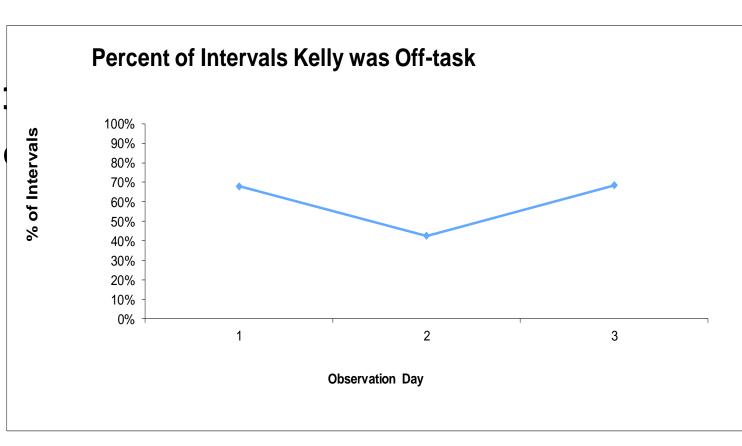

Force—amount of property destruction

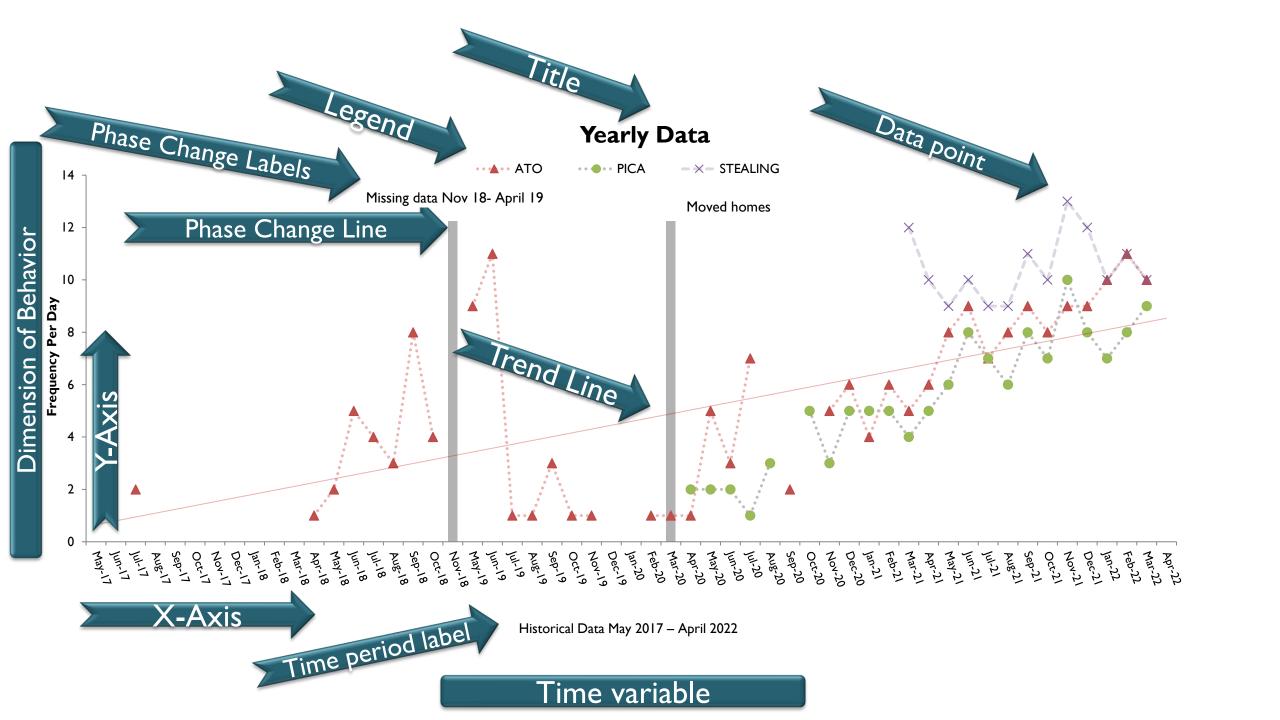

BENEFITS OF GRAPHING DATA

- Graphed data helps to make the results easier to interpret
- Graphs are a visual summary that provide an on-going visual record
- Graphs help to identity changes in behavior
- Graphs allow for interpretation of potential triggers

LINE GRAPHS

Use a **line graph** to summarize and show treacross time.

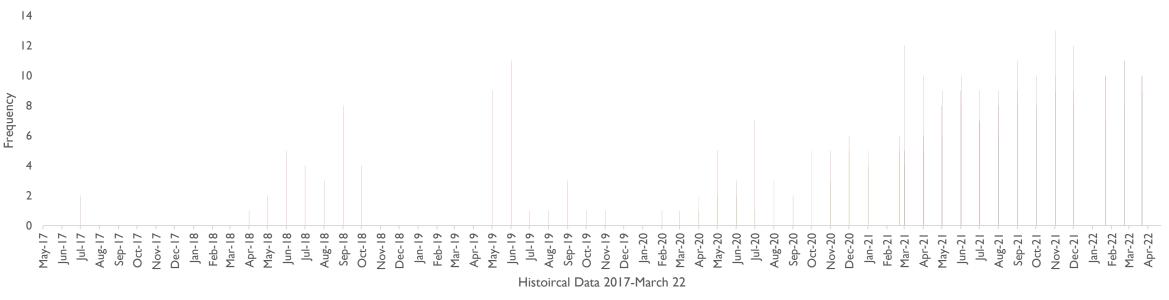

BAR GRAPHS

Bar graphs are helpful for summarizing or comparing data in categories

- Comparing antecedents and consequences
- Different types of behaviors
- Different types of settings

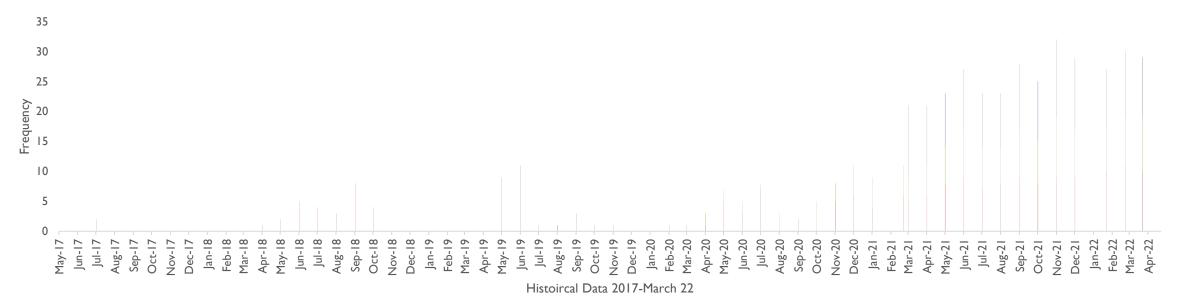

Behavior Data

■ATO ■PICA ■STEALING

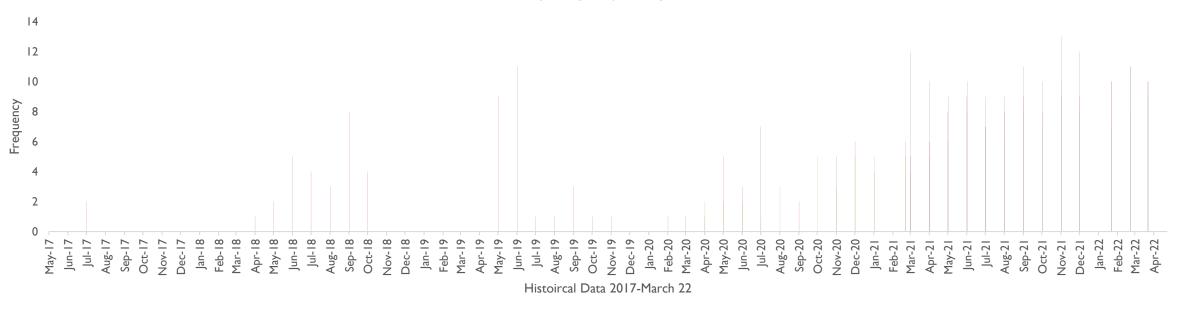

Behavior Data

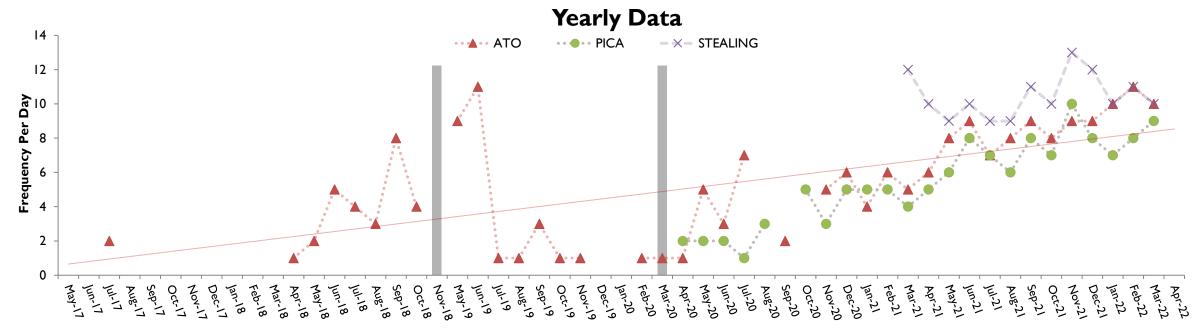

■ATO ■PICA ■STEALING

Behavior Data

■ATO ■PICA ■STEALING

EXAMPLE

Kelly is often **off-task** at job skills training. In addition, she has gotten into trouble for **screaming at peers** and **walking out** of the room during instruction.

- How would you know what to take data on?
 - Which behaviors are highest priority?
- Which aspects of the behavior would you choose? Why?
- Who would take the data?
- How will it be collected?

EXAMPLE

You could consider

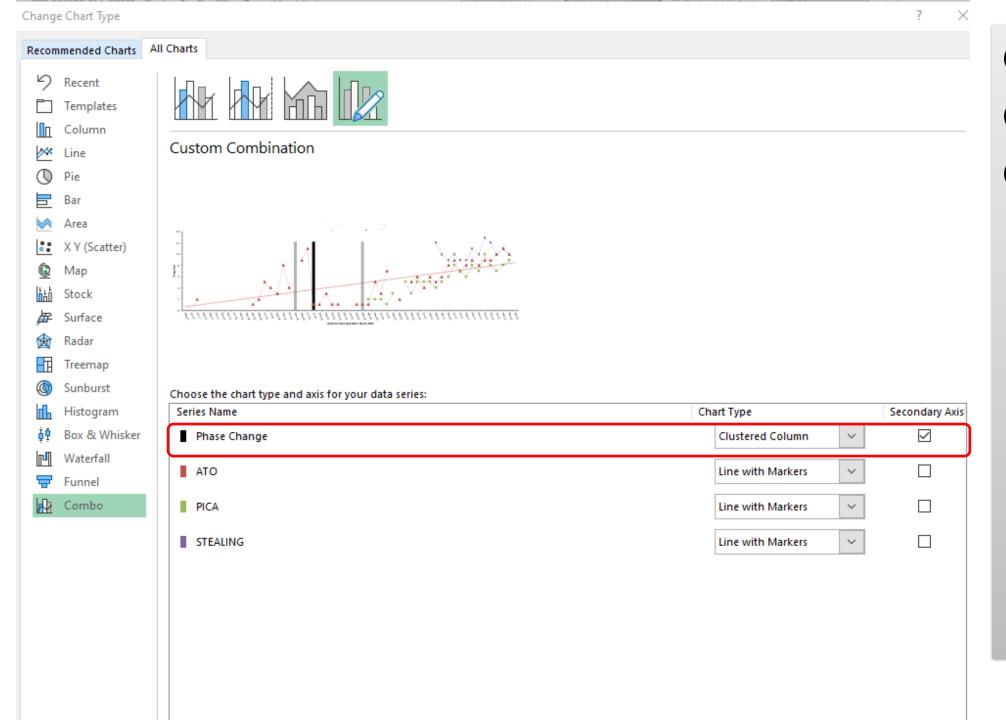

- Momentary time sampling Kelly's was on/off task behavior.
- The <u>frequency</u> of screaming at peers or walk-outs.
- Her job skills instructor or staff will collect and summarize the data.
- Once the data is graphed, the team can come together to determine which behavior should be targeted first and discuss any potential interventions.
